TABLE OF CONTENTS

Chapter No.	Title	Page No.
1	**Fundamentals of Thermodynamics**	1-30
	1.1 Introduction to Thermodynamics and Engineering Applications	
	1.2 Thermodynamic Systems, Surroundings and Boundaries	
	1.3 Closed Systems, Open Systems and Isolated Systems	
	1.4 Thermodynamic Properties, State and Equilibrium	
	1.5 Processes, Cycles and Quasi-Equilibrium Processes	
	1.6 Units, Dimensions and Engineering Problem-Solving Methodology	
2	**Properties of Pure Substances**	31-62
	2.1 Pure Substances and Phases of Matter	
	2.2 Property Diagrams and Phase-Change Processes	
	2.3 Pressure–Volume–Temperature Relationships	
	2.4 Thermodynamic Tables and Property Evaluation	
	2.5 Ideal-Gas Model and Gas Properties	
	2.6 Compressibility Factor and Real-Gas Behavior	
3	**Energy, Heat and Work**	63-99
	3.1 Forms of Energy in Thermodynamic Systems	
	3.2 Heat Transfer and Heat Interactions	
	3.3 Work Transfer and Boundary Work	
	3.4 First Law of Thermodynamics for Closed Systems	
	3.5 Internal Energy, Enthalpy and Specific Heats	
	3.6 First-Law Analysis of Thermodynamic Processes	
4	**Mass and Energy Analysis of Control Volumes**	100-130
	4.1 Control Volume and Control Surface Concepts	
	4.2 Conservation of Mass and Mass Flow Rate	
	4.3 Steady-Flow Energy Equation	
	4.4 Analysis of Nozzles, Diffusers and Turbines	
	4.5 Compressors, Pumps, Throttling Valves and Heat Exchangers	
	4.6 Transient and Unsteady-Flow Processes	

5 **Second Law of Thermodynamics** 131-160
5.1 Limitations of the First Law
5.2 Heat Engines, Refrigerators and Heat Pumps
5.3 Kelvin–Planck and Clausius Statements
5.4 Reversible and Irreversible Processes
5.5 Carnot Cycle and Carnot Principles
5.6 Thermodynamic Temperature Scale and Engineering Applications

6 **Entropy and Second-Law Analysis** 161-190
6.1 Entropy and the Clausius Inequality
6.2 Entropy Change of Pure Substances and Ideal Gases
6.3 Entropy Generation and Irreversibility
6.4 Entropy Balance for Closed Systems
6.5 Entropy Balance for Control Volumes
6.6 Second-Law Efficiency and Engineering Applications

7 **Exergy and Thermodynamic Availability** 191-218
7.1 Concept of Exergy and Available Energy
7.2 Reference Environment and Dead State
7.3 Physical and Chemical Exergy
7.4 Exergy Balance for Closed Systems
7.5 Exergy Analysis of Steady-Flow Devices
7.6 Exergy Destruction, Second-Law Efficiency and Energy Systems

8 **Thermodynamic Power Cycles** 219-247
8.1 Gas Power Cycles and Cycle Analysis
8.2 Otto, Diesel and Dual Cycles
8.3 Brayton Cycle and Gas Turbine Systems
8.4 Rankine Cycle and Steam Power Plants
8.5 Reheat, Regeneration and Combined Power Cycles
8.6 Performance Evaluation of Power Generation Systems

9 **Refrigeration, Heat Pumps and Psychrometrics** 248-277
9.1 Refrigeration Principles and Performance Measures
9.2 Vapor-Compression Refrigeration Cycle
9.3 Absorption Refrigeration and Alternative Refrigeration Systems
9.4 Heat Pumps and Heating Applications
9.5 Psychrometric Properties and Moist-Air Processes
9.6 Air-Conditioning Systems and Thermal Comfort

10 **Thermodynamics of Mixtures, Combustion and Modern Applications** 278-305

10.1 Properties of Ideal-Gas Mixtures and Gas Mixture Analysis

10.2 Psychrometric and Humid-Air Mixtures

10.3 Chemical Reactions and Combustion Thermodynamics

10.4 Thermodynamic Analysis of Reacting Systems

10.5 Thermodynamics of Energy, Environmental and Sustainable Systems

10.6 Emerging Applications: Renewable Energy, Hydrogen and Energy Storage

Reference 306-308
