

TABLE OF CONTENTS

Chapter No.	Title	Page No.
1	Foundations of Quantum Theory & Linear Algebra	01-14
	1.1 Classical vs quantum computing paradigm	
	1.2 Quantum mechanics postulates relevant to computing	
	1.3 Complex vector spaces, Dirac notation, inner products	
	1.4 Operator theory: unitary, Hermitian, eigenvalues	
2	Qubits, Quantum States & Multi-Qubit Systems	15-26
	2.1 Qubit representation & Bloch sphere	
	2.2 Mixed states, density matrices	
	2.3 Tensor products, entanglement basics	
3	Quantum Gates and Circuits – Gate Model	27-38
	3.1 Single & two-qubit gates	
	3.2 Gate universality & reversible computing	
	3.3 Quantum circuit design principles	
4	Quantum Protocols & Subroutines	39-53
	4.1 Quantum teleportation & superdense coding	
	4.2 Quantum oracles	
	4.3 Amplitude amplification & phase estimation	
5	Core Quantum Algorithms	54-72
	5.1 Deutsch-Jozsa algorithm	
	5.2 Simon's algorithm	
	5.3 Grover's search algorithm	
	5.4 Quantum Fourier Transform	
6	Advanced Quantum Algorithms & Applications	73-89
	6.1 Shor's factoring algorithm	
	6.2 Hamiltonian simulation	
	6.3 Quantum optimization & hybrid algorithms	
7	Quantum Error Correction & Fault Tolerance	90-108
	7.1 Decoherence & quantum noise	
	7.2 Quantum error-correcting codes	
	7.3 Stabilizer codes, thresholds & fault tolerance	

8	Quantum Hardware & Implementations	109-130
8.1	Superconducting qubits, trapped ions, photonics	
8.2	Error sources & noise models	
8.3	NISQ systems & limitations	
9	Quantum Software, Programming & Simulation	131-151
9.1	Quantum programming frameworks	
9.2	Classical simulation of quantum circuits	
9.3	Hybrid quantum-classical workflows	
10	Emerging Applications & Future Directions	152-173
10.1	Quantum cryptography & QKD	
10.2	Applications in chemistry, AI, optimization, biomedical	
10.3	Roadmap toward fault-tolerant quantum computing	
	Gate Questions	174-181
